AIUDA

PROJECT OVERVIEW

What is “aiuda”?

“Aiuda” is a tool developed to address a specific challenge within the university environment: many of the conditions that ensure access, comprehension, and inclusion are not inherently complex, yet they can be difficult to sustain in practice.

Tasks such as subtitling audiovisual materials, transcribing lectures, checking the readability of a presentation, or identifying accessibility issues often require time, technical expertise, or resources that are not always readily available. When these tasks go undone, it is generally not due to a lack of commitment on the part of educators, but rather a lack of suitable tools.

“Aiuda” aims to intervene at this juncture and enhance the educational process.

It leverages artificial intelligence to assist in the creation and improvement of educational materials. It enables the transcription, translation, and subtitling of content, as well as the analysis of presentations to generate recommendations for accessibility.

Its approach is clear: it neither replaces the work of educators nor automates pedagogical decisions.

Instead, it provides guidance, offers suggestions, and highlights areas for attention. The final judgment remains with those who teach.

Features

- ⚙️ Audio and Video Processing
  - Automatic transcription and subtitling
  - Translation of multimedia content
- 📄 Analysis of Documents and Presentations
  - Detects readability issues (e.g., small font sizes, overly long text)
  - Identifies accessibility issues (e.g., color contrast for colorblind users)
  - Points out basic writing issues and suggests improvements
- 🔒 Focus on Privacy
  - All processing takes place locally on institutional servers
  - No data is sent to external commercial platforms
- 🧩 Open and Replicable
  - Can be deployed locally within individual departments at universities, faculties, or research centers
  - Built using open-source tools and models
  - Usable by non-expert users

Benefits of Use

One of its key distinguishing features is its architecture. Aiuda operates within each university's own infrastructure, processing materials locally without sending information to external servers. This safeguards institutional content, protects faculty-created materials, and allows the institution to maintain its own policy regarding the use of artificial intelligence—all while avoiding the costs associated with credits or tokens required by commercial platforms.

The tool was designed to be simple, user-friendly, and scalable. It does not require advanced technical knowledge from faculty, nor does it alter existing teaching practices; instead, it integrates as a layer of support. Furthermore, it prioritizes the reliability of results over immediate output through a deferred processing system.

Its implementation is economically viable. It can be deployed on existing infrastructure or via affordable servers, allowing for various scales of adoption—whether at the institutional level, by individual faculties, or within specific working groups.

Aiuda does more than just generate results; it also offers educational value. By providing reports and suggestions, it enables faculty and pedagogical teams to identify accessibility issues and progressively improve their materials.

Adopting Aiuda is more than just incorporating a new tool; it represents an institutional decision. It signifies a move toward a university where accessibility is an effective, ongoing practice, and where artificial intelligence is integrated in a context-aware manner—under the institution's own control and in alignment with its public mission.
