All Aboard on Aiuda

Getting Started

If you are reading this page, it is because you are considering adopting—or have already decided to adopt— aiuda.

¡¡ CONGRATULATIONS !!

As you may have read in the "Presentation," this is a very powerful tool—one that is also simple and ensures the confidentiality of your materials.

This document outlines the requirements for implementing an "aiuda" platform within your academic unit.

1. We will review the necessary personnel.
2. We will cover the required technical infrastructure.
3. Finally, we will provide recommendations for a successful implementation.

More in-depth documentation regarding the technical aspects has been prepared and is available in the attached materials.

1 Required Personnel

To activate an "aiuda" instance, at least two professionals with clearly defined roles are required: a local sponsor and a system administrator.

Local Sponsor

A person with some level of authority is expected in the academic unit, generally this is the one who decides to launch the instance (probably you), since they will have the role of proposing the installation, supervising the implementation and implementation, in addition to later collecting and systematizing the perceptions of the users.

It requires someone with a vision of the future and awareness of the present, who can combine criteria and push an innovative project until its adoption.

System administrator

We require someone with experience in the installation and operation of computer systems in a Linux environment—an engineer with knowledge of GitHub, Linux systems, and Docker.

This individual may be a member of the IT team from their respective academic unit, but they must ensure their availability during the implementation phase and throughout subsequent operations. The time commitment for each of these tasks has not yet been determined.

2 Required IT infrastructure

To launch an *aiuda* pilot, a server is required—which could even be an old PC repurposed for this use—with the following minimum specifications:

4-core CPU; 8 GB of RAM; Ubuntu 22.04+; Docker Engine 24+ / Compose v2.

Recommended storage: approximately 200 GB (sufficient for 50 one-hour videos, each with 4 languages).
This is the minimum configuration, assuming the platform will not be under intensive use by a large group of teachers.

The server must be accessible from the local network used by the teachers. An internet connection is required solely for the initial installation of the platform, in order to download the repository; no such connectivity will be needed thereafter.

Further detailed information can be found in the document “aiuda - Hardware Requirements.”.

3 Recommendations for the approach

- Start with the commitment of the two actors.
- Ask the Systems Administrator to obtain the hardware and make the repository access request.
- Ask your Systems Administrator to install the service. It will probably require an internal domain and review of security conditions of the service. It's Open Source, so you can review everything before you start. It is recommended as a domain to use something like aiuda-<<department>.university.tld:
  For example, for the Online Education Office, EOL, of the University of Chile, the domain can be: aiuda-eol.uchile.cl
- Create, in agreement with your IT office, some platform access control system. IP backup system (via firewalls or reverse proxy), httpd engine's own control system such as .htpasswd, or some system associated with the access control systems of your academic unit.
- Perform tests by uploading a video file, an audio file, and a presentation to verify the system's functionality.
- Select a group of individuals (beta users) to test the platform.
- Hold a meeting with your group of beta users to explain what the platform is and what is expected to be tested.
- Define a specific duration for the testing period.
- Ensure that the group of beta users has access to your aiuda installation—that is, confirm that they can access it by opening a web browser.

- Ensure that your system administrator frequently checks that the system is operational and that the hard drive is not reaching capacity.

- Once the testing period has concluded, hold another meeting with the beta users to evaluate the continuity of the service.

- If you administer the proposed survey, please send the results to contacto-aiuda@uchile.cl for tabulation.
